

## 0.1 Transactions

### 0.1.1 Receiving confirmation after transaction

To receive confirmation of transaction status, store admin should set a "return url" in the store settings. This parameter is empty by default and no confirmations will be sent until it is populated.

When transaction is finished a POST request will be sent **once** to provided "return url". Here are the parameters:

- status - (bool) True if transaction succeeded and False if transaction failed
- id - (int) ID of transaction in payment gateway
- store - (int) ID address of the store
- email - (str) user email address
- name - (str) user name
- currency - (str) capitalized symbol (ie. BTC)
- amount - (float) amount of money that was paid (ie. 0.03)
- control - (str) control value to identify transaction
